

Business Systems Analysis Certificate

BA-05: Requirements Planning and Management Course

"We repeatedly face challenges in projects, but we never realized that they were related to the way we manage requirements and that there are solutions!"

This course is designed for Business Analysts, Senior Business Analysts, Business Analysis Managers or Team Leaders, and Project Managers who are involved in managing requirements throughout a software development project lifecycle.

Every day, projects suffer from challenges and complications related to requirements management not recognizing that the source of these issues and their solutions lie into managing requirements.

While most analysts address requirements engineering from merely the requirements definition perspective, very few understand the paramount importance of managing requirements beginning to end. The course will thus help you fill the gap in your current practice and introduce you to best worldwide practices of requirements management.

Duration: 6 hours
